System Organ Class	Adverse reactions
Nervous system disorders	Headache Dizziness
Gastrointestinal disorders	Nausea Lower abdominal pain Diarrhoea Vomiting
Reproductive system and breast disorders	Bleeding not related to menses* Delay of menses more than 7 days ** Irregular menstruation Breast tenderness
General disorders and administration site conditions	Fatigue

* Bleeding patterns may be temporarily disturbed, but most women will have their next menstrual period within 7 days of the expected time.
** If the next menstrual period is more than 5 days overdue, pregnancy should be excluded.

Overdose
Serious side effects have not been reported following acute ingestion of large doses of oral contraception. Overdose may cause nausea and withdrawal bleeding may occur. There is no specific antidote and treatment should focus on the symptoms

Pharmacological properties
Pharmacodynamic properties
Progestogens
Pharmacotherapeutic group: Emergency Contraceptive - G03AD01.
The precise mode of action of Levonorgestrel is not known. At the recommended regimen, Levonorgestrel is thought to work mainly by preventing ovulation and fertilization if intercourse has taken place in the preovulatory phase, when the likelihood of fertilization is the highest. It may also cause endometrial changes that discourage implantation. Levonorgestrel tablet is not effective once the process of implantation has begun.

1500 microgram single dose of Levonorgestrel tablet (taken within 72 hours of unprotected sex) prevented 84% of expected pregnancies (compared with 79% when the two 750 microgram tablets were taken 12 hours apart). At the recommended regimen, Levonorgestrel is not expected to induce significant modification of blood clotting factors, and lipid and carbohydrate metabolism.

Pharmacokinetic properties
Orally administered Levonorgestrel is rapidly and almost completely absorbed. Following ingestion of one tablet of Levonorgestrel maximum drug serum levels of Levonorgestrel of 18.5ng/ml were found at 2 hours. After reaching maximum serum levels, the concentration of Levonorgestrel decreased with a mean elimination half-life of about 26 hours.

Levonorgestrel is not excreted in unchanged form but as metabolites. Levonorgestrel metabolites are excreted in about equal proportions with urine and faeces. The biotransformation follows the known pathways of steroid metabolism, the Levonorgestrel is hydroxylated in the liver and the metabolites are excreted as glucuronide conjugates.

No pharmacologically active metabolites are known.

Levonorgestrel is bound to serum albumin and sex hormone binding globulin (SHBG). Only about 1.5% of the total serum levels are present as free steroid, but 65% are specifically bound to SHBG.

The absolute bioavailability of Levonorgestrel was determined to be almost 100% of the dose administered.
About 0.1% of the maternal dose can be transferred via milk to the nursed infant.

Pharmaceutical particulars
List of excipients
Lactose monohydrate,
Maize starch,
Povidone,
Silica, colloidal anhydrous,
Magnesium stearate

Incompatibilities
Not applicable

Shelf life
3 years

Special precautions for storage
Store below 30°C. Protect from light.
Keep out of reach of children

Nature and contents of container
PVC/PVDC/Aluminum-blister containing one tablet. The blister is packed in a carton.

Date of Revision: July 2022

Senador

Manufactured by:
Senador Laboratories Private Limited
Plot No. 20 & 21, Pharmez, Sarkhej - Bavla National Highway No. 08 A,
Near Village - Matoda, Tal. Sanand, Dist. Ahmedabad - 382213, Gujarat, India
