

CORTISONE CREAM

MAL19910181AZ

DESCRIPTION:

CREAM

Colour : White

Fragrance : Natural

CONTENT:

Hydrocortisone Acetate..... 1% w/w

PHARMACODYNAMICS:

Hydrocortisone is an adrenocorticoid which when applied externally will produce anti-inflammatory and anti-allergic actions in the skin. It diffuses across cell membranes and complexes with specific cytoplasmic receptors. These complexes then enter the cell nucleus, bind to DNA (chromatin), and stimulate transcription of messenger RNA (mRNA) and subsequent protein synthesis of various enzymes thought to be ultimately responsible for anti-inflammatory effects of topical application of adrenocorticoids.

PHARMACOKINETICS:

When applied externally, Hydrocortisone can be absorbed systematically and occlusion or use over extensive areas increases absorption of topical applied drug. Metabolism is mostly in the skin tissue.

INDICATION:

For the relief of the inflammatory and pruritic manifestations of corticosteroid-responsive dermatoses.

RECOMMENDED DOSE:

Apply a thin film of the cream to the affected area 1 - 3 times daily. Application once or twice a day is often feasible and effective. However, frequency of application should be determined according to severity of the condition while mild cases may respond to once a day application, more severe cases may require more frequent application.

CONTRAINDICATION:

History of sensitivity reaction to Hydrocortisone or other topical corticosteroids. Tuberculosis of the skin, bacterial or fungal infections and viral diseases, e.g. herpes simplex, varicella, vaccinia, acne vulgaris. It should not be used in pregnant patients in large amounts or for prolonged period of time.

WARNING AND PRECAUTIONS:

Treatment should be discontinued if irritation or sensitization develops with the use of the cream and appropriate therapy instituted. In the presence of an infection, the use of an appropriate antifungal or antibacterial agent should be instituted. If a favourable response does not occur promptly, the corticosteroids should be discontinued until the infection is controlled adequately. Any side effects that are reported following systematic use of corticosteroids, including adrenal suppression, may also occur with topical corticosteroids, especially in infants and children. Systematic absorption of topical corticosteroids will be increased if extensive body surface areas are treated or if the occlusive technique is used. Suitable precautions should be taken under these conditions or when long-term use is anticipated, particularly in infants and children.

DRUG INTERACTION:

Urea may enhance the absorption of the corticosteroid and this should be borne in mind, especially when long term treatment is contemplated.

PREGNANCY AND LACTATION:

There is inadequate evidence for safety in human pregnancy. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development including cleft palate and intra-uterine growth retardation. There may, therefore, be a very small risk of such effects in the human foetus.

SIDE EFFECTS/ADVERSE REACTIONS:

Local adverse reactions reported with the use of topical corticosteroids, especially under occlusive dressings, include burning, itching, irritation, dryness, folliculitis, hypertrichosis, acneiform eruptions, hypopigmentation, perioral dermatitis, allergic contact dermatitis, maceration of the skin, secondary infection, skin atrophy, striae and miliaria.

SYMPTOMS AND TREATMENT OF OVERDOSE:

Symptoms: Excessive prolonged use of topical corticosteroids can suppress pituitary-adrenal function resulting in secondary adrenal insufficiency.

Treatment: Appropriate symptomatic treatment is indicated. Acute hypercorticism symptoms are virtually reversible. Treat electrolyte imbalance, if necessary. In cases of chronic toxicity, slow withdrawal of steroids is advised.

PACKING/PACK SIZE(S):

Aluminium tube of 15 g and 50 x 15 g.

**JAUHI UBAT DARIPADA KANAK-KANAK
KEEP OUT OF REACH OF CHILDREN
FOR EXTERNAL USE ONLY**
