

Heart Failure and/or Symptomatic Left Ventricular Dysfunction : The initial dose of ACETEC in patients with symptomatic heart failure or symptomatic left ventricular dysfunction is 2.5 mg and it should be administered under close medical supervision to determine the initial effect on the blood pressure. In the absence of, or after effective management of, symptomatic hypotension following initiation of therapy with ACETEC in heart failure, the dose should be increased gradually to the usual maintenance dose of 20 mg, given in a single dose or 2 divided doses, as tolerated by the patient. This dose titration may be performed over a 2 to 4 weeks period, or more rapidly if indicated by the presence of residual signs and symptoms of heart failure. In patients with symptomatic heart failure, this dosage regimen was effective in reducing mortality. Blood pressure and renal function should be monitored closely both before and after starting treatment with ACETEC because hypotension and consequent renal failure have been reported. In patients treated with diuretics, the dose should be reduced if possible before beginning treatment with ACETEC. The appearance of hypotension after the initial dose of ACETEC does not imply that hypotension will recur during chronic therapy with ACETEC and does not preclude continued use of the drug. Serum potassium also should be monitored.

OVERDOSAGE-SYMPTOMS, TREATMENT, SUPPORTIVE THERAPY, ANTIDOTE (S) : The common symptom is hypotension. The recommended treatment of overdosage is IV infusion of normal saline solution.

If ingestion is recent, induce emesis. ACETEC may be removed from the circulation by hemodialysis.
