

TRISULMIX INJECTABLE Solution For Injection

Composition/100ml: Each Trisulmix Injection 100ml contains sulphadimethoxine (as sodium) 18.68g; trimethoprim 4.00g, methyl parahydroxybenzoate 0.10g.

Product Description: Clear liquid, yellow to orange colour.

Pharmacodynamics: Sulphadimethoxine is a long acting sulfamide with a wide antimicrobial spectrum including anti coccidia properties. This substance is active against Gram-positive and Gram-negative bacteria and certain protozoan such as coccidia. Trimethoprim belongs to diaminopyrimidine group. It is active against streptococci and most of Gram-negative bacteria.

In association, the two active substances are synergic. Sulphadimethoxine is potentiated by a diaminopyrimidine, trimethoprim. The combination of these two active substances allows a sequential blockade on the folic acid biosynthesis. These two active substances act by sequential way on the synthesis route of tetrahydrofolic acid: the sulphamide inhibits the PAB acid incorporation in folic acid and trimethoprim inhibits specifically the microbial dihydrofolate reductase. The theoretical activity spectrum includes Gram-positive organisms (*Staphylococcus*, *Listeria* ...) and Gram-negative organisms (*Escherichia coli*, *Salmonella*, *Proteus*, *Enterobacter*, *Bordetella* ...).

Pharmacokinetics: Sulphadimethoxine is considered as a sulphonamide with a long persistence in plasma rate. Sulphadimethoxine is highly protein bound. Drug diffuses widely into all tissues and organs.

Trimethoprim is rapidly absorbed after oral administration. It is widely distributed in the body. The two active substances are partly metabolized by liver. Their elimination is mainly renal.

Indication: Infections caused by or associated with organisms sensitive to the combination of trimethoprim and sulphadimethoxine.

Routes of administration: parenteral route –intramuscular, sub-cutaneous and slow intravenous

Dosage: Cattle, swine, sheep and goats: 1 ml per 10kg body weight per day (without exceeding 30ml) for 3 consecutive days

Contraindications: Do not use in case of intolerance to sulphonamides or trimethoprim and in severe hepatic or renal dysfunction.

Warnings and Precautions:

Special precautions for use in animals

In case of allergy, stop treatment.

Water abundantly the animals treated

Special precautions to be taken by person administering the veterinary medicinal product to animals

In case of symptoms as cutaneous eruption, consult a doctor and show him this information. An oedema at the level of the face, the eyelids, the lips or respiratory difficulties constitute severe symptoms and require urgent medical cares.

Avoid to handle this product in case of allergy to trimethoprim or sulphonamides

Special precautions for the disposal of unused product or waste materials

Any unused veterinary pharmaceutical product or waste materials derived from such veterinary pharmaceutical products shall be disposed of in accordance with local requirements.

Interactions with other medicaments: None known

Statement on usage during pregnancy and lactation: Teratogenic and foetotoxic effects have been reported in laboratory animals at doses more important than the recommended therapeutic doses. However, it can be used during pregnancy and lactation due to the existence of withdrawal period in milk.

Adverse Effects: None known

Overdose and Treatment: None known

Storage Conditions: The product should be stored at a temperature not exceeding 25°C, protected from light.

Withdrawal Period:

Meat and offal: 12 days

Milk: 12 milkings

Packing: 100 ml in glass bottle

FOR VETERINARY USE ONLY
